

## MAKITA 4329

The Woodworker  
RECOMMENDED

The latest jigsaw from Makita is a compact tool designed for serious DIY or light professional use. It has a generously rubber-padded handle with a large trigger, a lock-on button, and a variable speed wheel at the front top corner. A small four-position pendulum selector is fitted on the side.

The small alloy baseplate can be tilted to 45° in either direction using a hex key, which is stored on the back of the machine. A dust extraction tube is incorporated in the base of the machine, though with an internal diameter of 25mm you may need an adapter.

To change blades the hex key is again used, but access to the blade clamp is good so this isn't a difficult process. On the front of the machine is a sliding Perspex shield which can be extended down to enclose the blade completely. This makes the dust extraction really efficient and, surprisingly, doesn't actually obscure the view of the blade too much.

Despite cutting at a fairly sedate rate, the Makita runs very smoothly. Overall a good quality tool.
